

Print template - blind spot:

Procedure:

Below this text you can see a few ways to expose the blind spot. Print out the template and hold it close to your face for all tests. Cover your left eye and look intensively at the left image with your right eye. The image should be exactly in front of your right eye. Now you can slowly move the sheet away from you, but without changing your gaze. At a certain distance, the image of the right-hand picture hits the blind spot. Find out what happens then!

Experiment 1:

In this experiment you look at the squirrel. As soon as the image of the hazelnut hits the blind spot, it disappears, and you see only the white of your paper instead.

Experiment 2:

Here we look at the dot on the left. As soon as the white window in the table hits the blind spot, you will see a completely filled table, as your brain fills the gap with other image information.
